

I support the proposed new LF and 60 meter Amateur Radio bands.

I believe the proposed LF band limits are reasonable and will allow for considerable amateur experimentation. I do recommend that PLC systems be required to shift to more robust methods that will not be susceptible to RF interference as part of an overall need to increase the security of the US infrastructure. I also believe the arguments against allocation of a 160-190 KHz band do not make sense in light of no reported problems with GWEN communications.

I recommend that the narrow 60 meter band have the same restrictions as the narrow 30 meter band, i.e. be limited to CW and narrow band data/digital modes with a 200 watts PEP maximum. I believe that these limits will provide for effective domestic emergency communications and make the most effective use of the narrow allocation.

Regards, Tom Azlin N4ZPT
